

AMENDMENTS TO THE CLAIMS:

Please cancel claims 1-17 without prejudice and please add the following new claims:

18. (New) A method for producing a vehicle axle comprising:
 - directing a first blank (1) through a furnace (2) and heating the blank (1) to a working temperature;
 - directing the first blank (1) between a pair of rollers (3, 4) having profiled surfaces thereby performing the first blank (1) into an intermediate product having a predetermined profile along a longitudinal extent thereof;
 - feeding the first blank (1) to a forging press having a number of cooperating die pads, and working the first blank (1) to form a substantially finished product having a cross section substantially in the form of a hat profile of predetermined height, width and material thickness along a length thereof;
 - placing in connection with the hat profiled first blank (1), a second blank (14) having essentially the same profile as the hat profile of the first blank (1) in the dividing plane of the cooperating die pads; and
 - joining the first (1) and the second blank (14) together, at least respective edges thereof, to form a composite vehicle axle (18).
19. (New) The method as recited in claim 18, at least the first blank is forged vertically with respect to the principal plane in which the composite vehicle axle (18) is intended to be used.
20. (New) The method as recited in claim 18, the forging operation comprises a first step in which a pair of first cooperating die pads form the material in the first blank such that it acquires a predetermined, varying height in a vertical plane along a longitudinal extent thereof and the first blank further acquires a basic principal shape in the principal plane in which the composite vehicle axle (18) is intended to be used.

21. (New) The method as recited in claim 20, wherein the forging operation further comprises an additional step in which a pair of second cooperating die pads form the material in the first blank to a predetermined, varying thickness along a side surface, bottom surface and upper edge surface of the profile along a longitudinal extent thereof.
22. (New) The method as recited in claim 21, wherein the additional step of the forging operation is repeated at least one time in successive die pads until the first blank has acquired a final shape.
23. (New) The method as recited in claim 18, wherein the second blank is preformed in a separate forging operation to have substantially the same profile as the hat profile of the first blank in a dividing plane of the die pads.
24. (New) The method as recited in claim 18, wherein the first and the second blanks are formed in a joint forging operation in which the second blank is formed to the same profile as the hat profile of the first blank in a dividing plane of the die pads.
25. (New) The method as recited in claim 18, wherein the first and the second blanks are heated in a pair of separate induction furnaces and then placed between a pair of cooperating die pads in a press and joined together by forge welding.
26. (New) The method as recited in claim 18, wherein the first and the second blank are simultaneously heated using heating means introduced between the first and second blank, which blanks are held between a pair of cooperating die pads in a press and the first and second blank are joined together by forge welding.
27. (New) The method as recited in claim 26, wherein the heating is effected by means of one of an induction elements, an induction furnace, and a gas flame.

28. (New) The method as recited in claim 18, further comprising:

cutting flashes along the joined edges of the profile in the same press operation as for joining together the first and second blank, the profile acquiring a predetermined varying width along a longitudinal extent thereof.

29. (New) The method as recited in claim 18, wherein the vehicle axle comprises a first section having a cross section substantially taking the form of a hat profile of a predetermined, varying width, height and material thickness along a length thereof and a second section having an essentially constant material thickness and being joined together with the first section along side surfaces of the hat profile.

30. (New) The method as recited in claim 29, wherein the vehicle axle is constructed from a microalloyed steel.

31. (New) The method as recited in claim 29, wherein the vehicle axle constitutes a front axle beam.

32. (New) The method as recited in claim 31, wherein a maximum material thickness of the front axle beam is obtained in connection with fastening points and regions which are to be subjected to external forces and moments.

33. (New) The method as recited in claim 32, wherein the cross section of the front axle beam has essentially the same outer contours in both the vertical and horizontal planes as a conventionally forged, solid beam.
